Options Strategy Backtester (CSP / CC / Credit Spreads)

Type a strategy in the box like:

- `CSP(delta=0.30, dte=30, exit_pct=0.50)`
- `CC(delta=0.20, dte=14, exit_pct=0.50)`
- `PCS(delta=0.30, dte=30, width=5, credit_min=0.20)` (Put credit spread)
- `CCS(delta=0.20, dte=30, width=5, credit_min=0.20)` (Call credit spread)

Notes

- This is a *model-based* backtest (BS price + realized-vol IV proxy).
- For real-world accuracy, swap in real options chain history (QuantConnect, ORATS, CBOE, Polygon, etc.).

Strategy

CSP(delta=0.30, dte=30, exit_pct=0.50)

Run backtest

Parsed strategy:

```
StrategySpec StrategySpec(name='CSP', params={'delta': 0.3, 'dte': 30, 'exit_pct': 0.5})
```

```
StrategySpec(name: str, params: Dict[str, Any])
```

```
name str 'CSP'
```

```
params dict {'delta': 0.3, 'dte': 30, 'exit_pct': 0.5}
```
